*HttpGetClient addresses the common problem of automating web queries and downloads.*

**High Level Requirement**

*A service is available on an http server. This action requires a manual intervention, which breaks the automated workflow.*

**Solution**

*An unattended standard http query/download program, which can be called by any program. download url and fields names are passed as parameters to the program. Other available parameters are a configurable log file, a user name and a password. The server returned result is captured to continue the workflow.*

**Suggested uses**

*Any situation where numerous queries or downlaods need executing on an http or https server.  
Any situation where further action need to happen on the client based on the returned data type.  
A great companion for any web server either the client or server side.*

**Main benefits**

*A truly standard and secure web service method that can be used against any http server URL.  
Can easily be invoked from your non-java applications.  
Can easily be embedded in your java applications.  
Can run as a Thread in your java applications.*
