*HttpPostClient addresses the common problem of automating file uploads.*

**High Level Requirement**

*A file is ready to upload to an http server. This action requires a manual intervention, which breaks the automated workflow.*

**Solution**

*An unattended standard http upload program, which can be called by any program.*

*Upload url, files and fields names are passed as parameters to the program.*

*Other available parameters are a configurable log file, a user name and a password.*

*The server returned result is captured to continue the workflow.*

**Suggested uses**

*Any situation where numerous files need uploading to an http or https server.*

*Any situation where further action need to happen on the server based on data type.*

*A great companion for HttpPostServer on either the client or server side.*

**Main benefits**

*A truly standard and secure upload method that can be used against any http server URL configured to accept uploads (http POST operation).*

*Performs text and binary uploads.*

*Can easily be invoked from your non-java applications.*

*Can easily be embedded in your java applications.*

*Can run as a Thread in your java applications.*
